NMR for Physical and Biological Scientists 2006-06-30 a 5 year 6 759 case database of high resolution shallow water frequency direction spectra is examined by classifying spectra in discrete ranges of three parameters characteristic wave height spectral peak frequency and spectral peak direction counting the number of cases in each classification reveals the distribution of the spectral population in the three parameter domain averaging spectra within parametric classes defines characteristic spectra that can be used to describe nearshore wave conditions more completely when only three parameters are known or estimated though the results are specifically unique to the north carolina outer banks experiment site the field research facility of the u s army engineer waterways experiment station coastal engineering research center they are illustrative of the variability of wave energy distributions possible in nature computation of longshore energy fluxes and radiation stress tensor components using characteristic spectra and the three parameter guidance of the shore protection manual reveals significant differences and suggests that the ability to measure directional distributions of wave energy with high resolution is critical to the further improvement of modeling and predictive ability energy flux wave climate frequency direction spectra wave database radiation stress wind waves

Acts, Resolutions and Memorials Adopted by the First Legislative Assembly of the Territory of Arizona 1865 in this paper we discuss the wave resolution properties of the fourier approximation of a wave function with discontinuities it is well known that a minimum of two points per wave is needed to resolve a periodic wave function using fourier expansions for chebyshev approximations of a wave function a minimum of pi points per wave is needed 3 here we obtain an estimate for the minimum number of points per wave to resolve a discontinuous wave based on its fourier coefficients in our recent work on overcoming the gibbs phenomenon we have shown that the fourier coefficients of a discontinuous function contain enough information to reconstruct with exponential accuracy the coefficients of a rapidly converging gegenbauer expansion we therefore study the resolution properties of a gegenbauer expansion where both the number of terms and the order increase

Resolutions and Decisions of the Security Council 2013-2014 2016-04-21 detailed topographic landform analyses are the foundation of many geomorphologic investigations terrestrial laser scanning tls is the favored survey method for studies that require high resolution surface models however practical considerations such as the high cost of instrumentation and intensive field work required to implement this approach present possible limitations for its use in budget limited or large area studies in contrast a promising alternative approach for collecting high resolution geospatial data collection using close range digital photogrammetry crdp provides rapid results for large study areas with a low cost of entry however the lack of published data obtained regarding crdp methods and results makes it difficult to know if the resolution and accuracy of resultant survey data is comparable to tls in this study we compare the practical issues data collection data processing and results obtained from a time series of annual tls and crdp surveys performed in tandem over three years to monitor the spatial patterns of erosion and deposition along a point bar in white clay creek newark delaware evaluation of the differences between crdp and tls surface models reveals that the two methods produce dissimilar digital elevation models largely due to how each method detects bare earth and vegetation differently as such the volumetric change measurements of erosion and deposition along our study point bar differ significantly between the two methods our results suggest that in rough obstructed and dynamic terrains crdp may not be suitable high resolution topographic survey method however a holistic view of survey design considerations i e desired spatial resolution the need for high resolution multispectral orthoimages total project budget and field time may require the consideration of crdp as a heuristic survey method for many applications
