business as usual it is widely accepted will exceed the earth's carrying capacity in an alarmingly short space of time in simple terms we need to learn to use the world's rapidly depleting resources in a significantly more efficient manner practical and readily adopted solutions are needed now eco efficiency or produce more with less is achieved when goods and services satisfy human needs increase the quality of life at competitive prices and when environmental impacts and resource intensity are decreased to a degree that keeps them within the limits of earth's expected carrying capacity eco efficiency a term first proposed by the world business council for sustainable development in 1992 is a management approach that allows businesses to carry out environmental protection measures from a market oriented point of view with the aim of illustrating that ecology and the economy do not need to be a contradiction indeed eco efficiency has been portrayed as a win win for both business and the environment this book which developed out of two conferences on eco efficiency held in düsseldorf in 1998 and 2001 is edited by ernst ulrich von weizsäcker and his team from the wuppertal institute for climate environment and energy one of the world's leading research programmes on resource productivity the aim is not simply to explain the past and present of eco efficiency but to look forward to and encourage a future where the comprehensive take up of the concept by business government and consumers could lead to innovation on a grand scale and the possibility of a giant leap beyond towards overall sustainability there have been considerable achievements to date the dow jones sustainability index which aims to list the most sustainable corporations for investors includes companies such as basf climatex henkel and matushita panasonic all represented in this book who are implementing eco efficiency measures a number of political initiatives have also been formed in december 2001 the german government suggested a national sustainability strategy to measure germany's sustainable development while this not yet an accepted political target or even law it shows that politics is moving toward binding targets for increasing efficiency eco efficiency and beyond collects

together the leading thinkers on the topic and aims to illustrate not only that the concept should be part of every business strategy but that it is a key trigger for innovation innovation cuts through paradoxes it is the creation of solutions to conflicting demands flying in a vacuum gave us rockets and satellites switching electrons through insulators gave us silicon valley and the digital age sustainable development presents a similar field of paradoxical innovation forces i e provide affordable products and services for the growing unmet needs of the world population while reducing environmental impacts this book is the definitive collection on eco efficiency and will be required reading for business government ngos and academicians

conventional thermal power generating plants reject a large amount of energy every year if this rejected heat were to be used through district heating networks given prior energy valorisation there would be a noticeable decrease in the amount of fossil fuels imported for heating as a consequence benefits would be experienced in the form of an increase in energy efficiency an improvement in energy security and a minimisation of emitted greenhouse gases given that heat demand is not expected to decrease significantly in the medium term district heating networks show the greatest potential for the development of cogeneration due to their cost competitiveness flexibility in terms of the ability to use renewable energy resources such as geothermal or solar thermal and fossil fuels more specifically the residual heat from combustion and the fact that in some cases losses to a country region s energy balance can be easily integrated into district heating networks which would not be the case in a fully electric future district heating and cooling networks and cogeneration could become a key element for a future with greater energy security while being more sustainable if appropriate measures were implemented this book therefore seeks to propose an energy strategy for a number of cities regions countries by proposing appropriate measures supported by detailed case studies
