structural analysis is usually carried out by a strength of materials approach that allows complex 3 d structures to be modelled adequately for design needs in a single dimension however this approach is not extensively used in geotechnical engineering partly because 3 d media soil rock are present but more importantly because until recently the methods necessary to carry out this form of analysis did not exist in the last ten years efforts at modelling practical problems in foundation analysis using a strength of materials approach have developed the concept of the conical bar or beam as a tool such cone models can be used to model a foundation in a dynamic soil structure interaction analysis with a variation of the properties with depth this book develops this new approach from scratch in a readable and accessible manner a systematic evaluation for a wide range of actual sites demonstrates sufficient engineering accuracy a short computer program written in matlab and a user friendly executable program are provided while practical examples ensure a clear understanding of the topic simplifies complex 3 d analysis of soil structure interaction applies strength of materials approach to geotechnical engineering illustrated with practical examples executable program and matlab program for foundation vibration analysis
