the mission of the united states army is to fight and win our nation's wars by providing prompt sustained land dominance across the full range of military operations and spectrum of conflict in support of combatant commanders accomplishing this mission rests on the ability of the army to equip and move its forces to the battle and sustain them while they are engaged logistics provides the backbone for army combat operations without fuel ammunition rations and other supplies the army would grind to a halt the u s military must be prepared to fight anywhere on the globe and in an era of coalition warfare to logistically support its allies while aircraft can move large amounts of supplies the vast majority must be carried on ocean going vessels and unloaded at ports that may be at a great distance from the battlefield as the wars in afghanistan and iraq have shown the costs of conveying vast quantities of supplies is tallied not only in economic terms but also in terms of lives lost in the movement of the materiel as the ability of potential enemies to interdict movement to the battlefield and

interdict movements in the battlespace increases the challenge of logistics grows even larger no matter how the nature of battle develops logistics will remain a key factor force multiplying technologies for logistics support to military operations explores army logistics in a global complex environment that includes the increasing use of antiaccess and area denial tactics and technologies by potential adversaries this report describes new technologies and systems that would reduce the demand for logistics and meet the demand at the point of need make maintenance more efficient improve inter and intratheater mobility and improve near real time in transit visibility force multiplying technologies also explores options for the army to operate with the other services and improve its support of special operations forces this report provides a logistics centric research and development investment strategy and illustrative examples of how improved logistics could look in the future

the gap between demand for consumer goods and their efficient supply is greater now than at any other time and is widening as consumers wants become less predictable and suppliers struggle to meet them quick response qr is both a management paradigm and a methodology that allows supply systems to react quickly to changes while improving their performance qr aims to help organize a business in the face of problems associated with the vast array of goods and services now to be found in consumer markets it is particularly relevant to the fast moving consumer goods fmcg and fashion industries qr works by compressing the time between product or service design concept and appearance on the retail shelf it then takes advantage of such recent technologies as point of sale pos tracking and electronic data interchange edi to constantly up date estimates of true consumer demand and then places intelligent re orders for goods with flexible manufacturers and their suppliers one of the features of this book is the demonstration that the range of industries able to benefit from the application of qr methodologies is extremely wide however this apparent universality comes with a strong health warning by placing qr in a broad framework of management thinking the book allows comparison with other paradigms and their off shoots partnerships and alliances measurement and benchmarking information systems technology strategies total quality

management and change management belief systems such as world class manufacturing lean production agile manufacturing virtual organization time based competition supply chain management scm and chaos theory are also reviewed and contrasted the book then quantifies the performance benefits that accrue from the application of qr using examples from the us and european industries as well as computer simulation lessons are also drawn from a wide variety of smes small and medium sized enterprises who are using qr as a strategic tool as well as those who have not yet adopted it for the latter there are recommendations for implementing qr the future management and research directions required for full exploitation of qr are also explored in a separate section the most important aspect of this book is that it concentrates on the practical hands on management of a supply pipeline as opposed to the generalized theories of supply chain management
