engineering physiology bases of human factors ergonomics how tall are people nowadays how far can we reach how high do we sit how strongly do we push with a hand or foot how does the body develop strength what are our work capabilities how can we measure and judge them how can we at the same time make work easy and effective engineering physiology third edition describes the bases of human factors and ergonomics by providing answers to these and many other questions concerning the size build and functioning of the human body at work this information is presented in clear concise language not in the jargon of physiology biology or medicine it does not require background knowledge from the reader just interest and it is interesting to read this practical guide shows how the body monitors itself how it reacts to workloads and environmental stresses such as heat or cold humidity and wind each chapter focuses on real world applications of specific physiological knowledge in the workplace to help assure high performance with minimal effort a wealth of information on anthropometry is also included exploring the size and mobility of the human body and the various ways of designing for different sizes there is no average person there is a thorough discussion of the architecture functioning and biomechanics of bones joints muscles tendons and ligaments it becomes clear how they develop forces and torques and move the body at work or sports overhead work or sitting and standing still for a long time is fatiguing the team of authors explains why our bodies prefer dynamic activities to sustained static effort we want to move about the book explains energy extraction from food and drink what efforts the body is capable of and how this depends on the cooperation of respiratory circulatory and metabolic systems it points out ways of measuring and assessing a person s ability to work and continue working such as the observation of a subject s breathing rate heart beat rate and oxygen consumption the effects of environmental conditions heat cold humidity air movement and of shift work day evening and night work on task performance are discussed in practical terms there are advantages and some drawbacks to compressed work weeks and flextime the third edition of engineering physiology has new information on body size and how to fit equipment to it the book describes how we develop muscle strength and transmit it along the limbs to a handle or pedal and how to design for that application of force or torque it explains what happens in repetitive trauma and how to avoid carpal tunnel syndrome what can we expect from reengineering the body how can artificial joints replace worn out hips and knees the third edition of this successful book provides numerous ideas to human factors engineers designers managers industrial hygienists safety personnel plant engineers and supervisors students and anyone else interested in the ergonomics of fitting work to the human body

not only developed countries but also most developing areas of the world have experienced a surge in obesity prevalence over recent decades obesity complications are now among the leading causes of premature mortality encompassing conditions such as coronary heart disease stroke and type 2 diabetes this places a heavy burden on contemporary healthcare systems while rodent models have limitations as experimental models of human obesity related disease study of rats and mice either spontaneously prone or resistant to obesity or genetically engineered to illuminate underlying mechanisms has yielded key information about the metabolic defects linked to obesity and their associated diseases this topic includes both original research studies and reviews of the use of animal studies in specific areas of obesity related disease various methodological approaches are discussed with evaluation of the extent to which use of animal models has facilitated progress or conversely has proved a cul de sac in investigation of human disease mechanisms consideration is also given to future strategies to use such rodent models optimally to enhance comprehension and treatment of pandemic human obesity related diseases

argues for a humanistic cultural reformation to counter our materialistic values and science dominated intellectual life and shows how this would affect our lives and transform our society a society fit for human beings contends that there is a profound incoherence in the foundations of modern western civilization and that we are on a self destructive course with the quest for wealth and power our dominant concern we find ourselves with a flourishing economy and a supreme military force based on science and technology but with our moral civic and religious culture undermined by our way of comprehending the world our human identity is problematic the wells of meaning that nourish the human spirit are polluted or drying up and the social order is in disarray this situation e m adams argues requires nothing less than a historic cultural revolution based on a shift in priorities from wealth and power to humanistic values those grounded in selfhood and lived experience that are essential for human growth meaningful lives and a healthy society such a shift in our governing values would require a restructuring of our intellectual vision of humankind and the world in terms of humanistic categories this book shows the import of such a humanistic cultural revolution for our human identity morality the social order and our major institutions including the family and community education the economy the government the military and religion it outlines how we can work toward such a cultural revolution and develop a constructive postmodern civilization with a society fit for human beings

the analysis of experimental data is at heart of science from its beginnings but it was the advent of digital computers that allowed the execution of highly non linear and increasingly complex data analysis procedures methods that were completely unfeasible before non linear curve fitting clustering and machine learning belong to these modern techniques which are a further step towards computational intelligence the goal of this book is to provide an interactive and illustrative guide to these topics it concentrates on the road from two dimensional curve fitting to multidimensional clustering and machine learning with neural networks or support vector machines along the way topics like mathematical optimization or evolutionary algorithms are touched all concepts and ideas are outlined in a clear cut manner with graphically depicted plausibility arguments and a little elementary mathematics the major topics are extensively outlined with exploratory examples and applications the primary goal is to be as illustrative as possible without hiding problems and pitfalls but to address them the character of an illustrative cookbook is complemented with specific sections that address more fundamental questions like the relation between machine learning and human intelligence these sections may be skipped without affecting the main road but they will open up possibly interesting insights beyond the mere data message all topics are completely demonstrated with the aid of the commercial computing platform mathematica and the computational intelligence packages cip a high level function library developed with mathematica s programming language on top of mathematica s algorithms cip is open source so the detailed code of every method is freely accessible all examples and applications shown throughout the book may be used and customized by the reader without any restrictions the target readerships are students of computer science and engineering as well as scientific practitioners in industry and academia who deserve an illustrative introduction to these topics readers with programming skills may easily port and customize the provided code
