this is a portfolio of a mixed bag of events and objects that have caught my eye and been recorded as of interest to me ilford s old slogan for faces and places was very apt it could take just sixty minutes to look through the book or you may want to look through sixty times who knows it spans a sixty year period of life which has passed by my lens i have selected the most memorable ones which are likely to mean more to viewers beyond the family circle so to speak photography can be so so personal i have found many of these images can never be repeated some will stand the test of time better than others i would like to think that british amateur photojournalism never dies and ordinary people such as myself can and will make the effort to continue recording for posterity in black and white please it has for me and many enthusiasts alike an archaic charm that no other art form can beat

the concept of remote sensing as a way of capturing information from an object without making contact with it has until recently been exclusively focused on the use of earth observation satellites the emergence of unmanned aerial vehicles uav with global navigation satellite system gnss controlled navigation and sensor carrying capabilities has increased the number of publications related to new remote sensing from much closer distances previous knowledge about the behavior of the earth s surface under the incidence different wavelengths of energy has been successfully applied to a large amount of data recorded from uavs thereby increasing the spatial and temporal resolution of the products obtained more specifically the ability of uavs to be positioned in the air at pre programmed coordinate points to track flight paths and in any case to record the coordinates of the sensor position at the time of the shot and at the pitch yaw and roll angles have opened an interesting field of applications for low altitude aerial photogrammetry known as uav photogrammetry in addition photogrammetric data processing has been improved thanks to the combination of new algorithms e g structure from motion sfm which solves the collinearity equations without the need for any control point producing a cloud of points referenced to an arbitrary

coordinate system and a full camera calibration and the multi view stereopsis mvs algorithm which applies an expanding procedure of sparse set of matched keypoints in order to obtain a dense point cloud the set of technical advances described above allows for geometric modeling of terrain surfaces with high accuracy minimizing the need for topographic campaigns for georeferencing of such products this special issue aims to compile some applications realized thanks to the synergies established between new remote sensing from close distances and uav photogrammetry

unmanned aerial vehicles uavs are new platforms that have been increasingly used in the last few years for forestry applications that benefit from the added value of flexibility low cost reliability autonomy and capability of timely provision of high resolution data the main adopted image based technologies are rgb multispectral and thermal infrared lidar sensors are becoming commonly used to improve the estimation of relevant plant traits in comparison with other permanent ecosystems forests are particularly affected by climatic changes due to the longevity of the trees and the primary objective is the conservation and protection of forests nevertheless forestry and agriculture involve the cultivation of renewable raw materials with the difference that forestry is less tied to economic aspects and this is reflected by the delay in using new monitoring technologies the main forestry applications are aimed toward inventory of resources map diseases species classification fire monitoring and spatial gap estimation this special issue focuses on new technologies uav and sensors and innovative data elaboration methodologies object recognition and machine vision for applications in forestry
