aline leon in the last years public attention was increasingly shifted by the media and world governments to the concept of saving energy reducing pollution protecting the vironment and developing long term energy supply solutions in parallel research funding relating to alternative fuels and energy carriers is increasing on both tional and international levels why has future energy supply become such a matter of concern the reasons are the problems created by the world s current energy supply s tem which is mainly based on fossil fuels in fact the energystored in hydrocarb based solid liquid and gaseous fuels was is and will be widely consumed for internal combustion engine based transportation for electricity and heat generation in residential and industrial sectors and for the production of

fertilizers in agriculture as it is convenient abundant and cheap however such a widespread use of fossil fuels by a constantly growing world population from 2.3 billion in 1939 to 6.5 billion in 2006 gives rise to the two problems of oil supply and environmental degradation the problem related to oil supply is caused by the fact that fossil fuels are not renewable primary energy sources this means that since the first barrel of petroleum has been pumped out from the ground we have been exhausting a heritage given by nature

this text is a thorough treatment of the rapidly growing area of aerial manipulation it details all the design steps required for the modeling and control of unmanned aerial vehicles uav equipped with robotic manipulators starting with the physical basics of rigid body kinematics the book gives an in depth presentation of local and global coordinates together with the representation of orientation and motion in fixed and moving coordinate systems coverage of the kinematics and dynamics of unmanned aerial vehicles is developed in a succession of popular uav configurations for multicopter systems such an arrangement supported by frequent examples and end of chapter exercises leads the reader from simple to more complex uav configurations propulsion system aerodynamics essential in uav design is analyzed through blade element and momentum theories analysis which is followed by a description of drag and ground aerodynamic effects the central part of the book is dedicated to aerial manipulator kinematics dynamics and control based on foundations laid in the opening chapters this portion of the book is a structured presentation of newton euler dynamic modeling that results in forward and backward equations in both fixed and moving coordinate systems the lagrange euler approach is applied to expand the model further providing formalisms to model the variable moment of inertia later used to analyze the dynamics of aerial manipulators in contact with the environment using knowledge from sensor data insights are presented into the ways in which linear robust and adaptive control techniques can be applied in aerial manipulation so as to tackle the real world problems faced by scholars and engineers in the design and implementation of aerial robotics systems the book is completed by path and trajectory planning with vision based examples for tracking and manipulation
